

Deep-time age-depth modeling in R

Niklas Hohmann (N.H.Hohmann@uu.nl)

Christian Zeeden

Three packages, 4 methods

- modifiedBChron: Deeptime extension of Bchron using radioisotope data & a sediment accumulation model (Trayler et al. 2020)
- astroBayes: Radioisotope data & cyclostratigraphy (Trayler et al. 2024)
- Admtools: 2 methods (Hohmann et al. 2025)
 - Sedimentation rates
 - Observation on tracer fluxes (e.g., Pollen, extraterrestrial ^3He , etc.)

Practical – rest of the day, in groups

- Work through the provided practical
- Choose a package that is most relevant to you
- Work through the tasks

Consider and discuss:

- Are the model assumptions made plausible for your study system?
- What expert knowledge do you have that you can not incorporate into the age-depth models?
- What (software) functionality is missing?
